

MaidSafe

& THE SAFE NETWORK

A SECURE, SERVERLESS INTERNET

Paige Peterson - Communications, MaidSafe
BattleMesh V8, Maribor, 07 August 2015

A background network diagram consisting of a complex web of interconnected nodes and lines, resembling a decentralized network or blockchain structure. The nodes are represented by small circles, and the lines are thin, light gray connections between them.

INTRO

STACK

HISTORY

Massive array of internet disks, secure access for everyone

The SAFE Network is an alternative Internet infrastructure and development platform for decentralising storage and communication while making privacy and security priority.

serverless

crypto secured

personal, private or public data

autonomous

token mechanisation

The background of the slide features a complex network diagram. It consists of numerous small, light-gray circular nodes connected by thin, light-gray lines. These connections form a dense, interconnected web that fills the entire background, with some areas appearing more clustered than others. The overall aesthetic is technical and digital.

INTRO

STACK

HISTORY

Natural to align with mesh networking

Access to the network

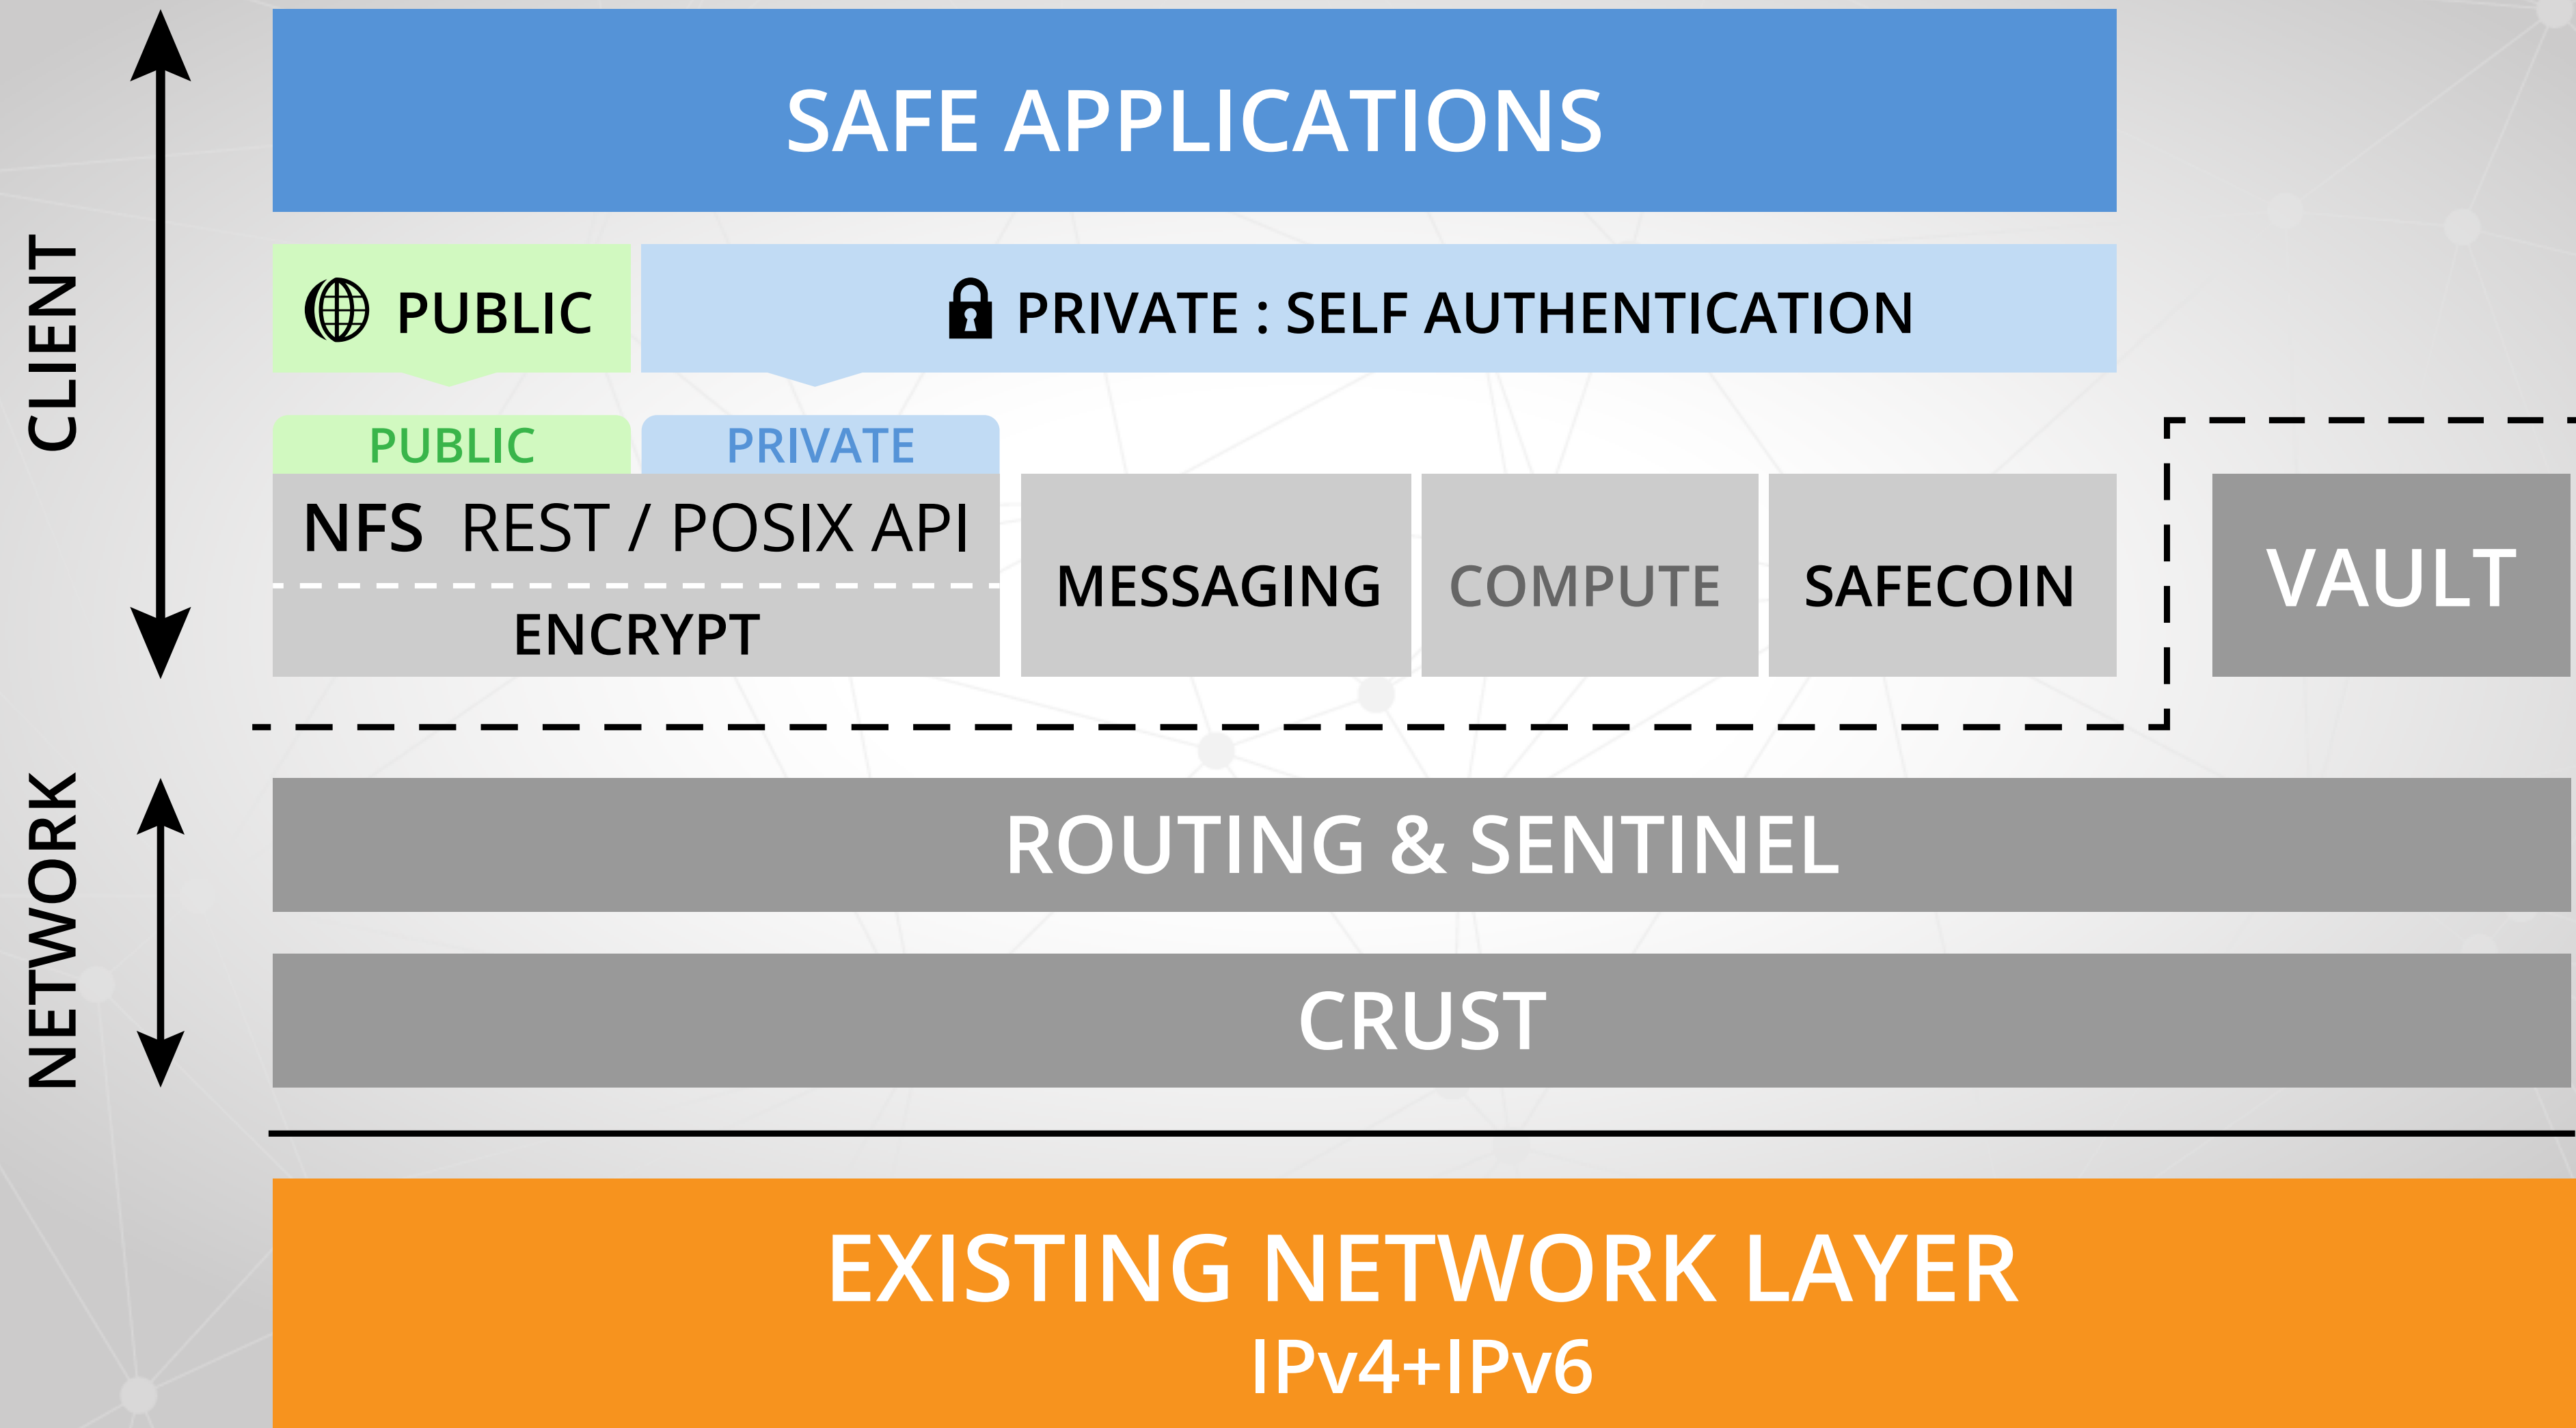

Security layer

Creating a censorless Internet
(Implements global, non-location based addresses)

HISTORY

Routing + Sentinel

Modified Kademlia DHT
(with public key infrastructure)

DHT PKI determines namespace and
XOR distance for node authority

Language of the network

- persona/roles
- messages (data type id, persona id)
- group consensus (quorum)

INTRO

STACK

HISTORY

Put

Client -> ClientManager<->NeaManager->NodeManager->ManagedNode

- Client sends message to his own address on the network
- ClientManagers receive this and check it is a client he has available storage
- They send to the DataManagers which check the from Authority is a ClientManager group and look to see if data is already stored. If so then Finish, else...
- DataManagers send to a PmidManager group.
- PmidManagers check from authority was DataManagers and they store in a node close to the address of the group.
- PmidNode receives this Put and checks the from authority was his PmidManager group.
- Pmid Node stores data. Finish.
